HADES

The High Acceptance Di-Electron Spectrometer **HADES** is a fixed target detector located at SIS18 at Helmholtzzentrum für Schwerionenforschung in Darmstadt, Germany.

Physics program:

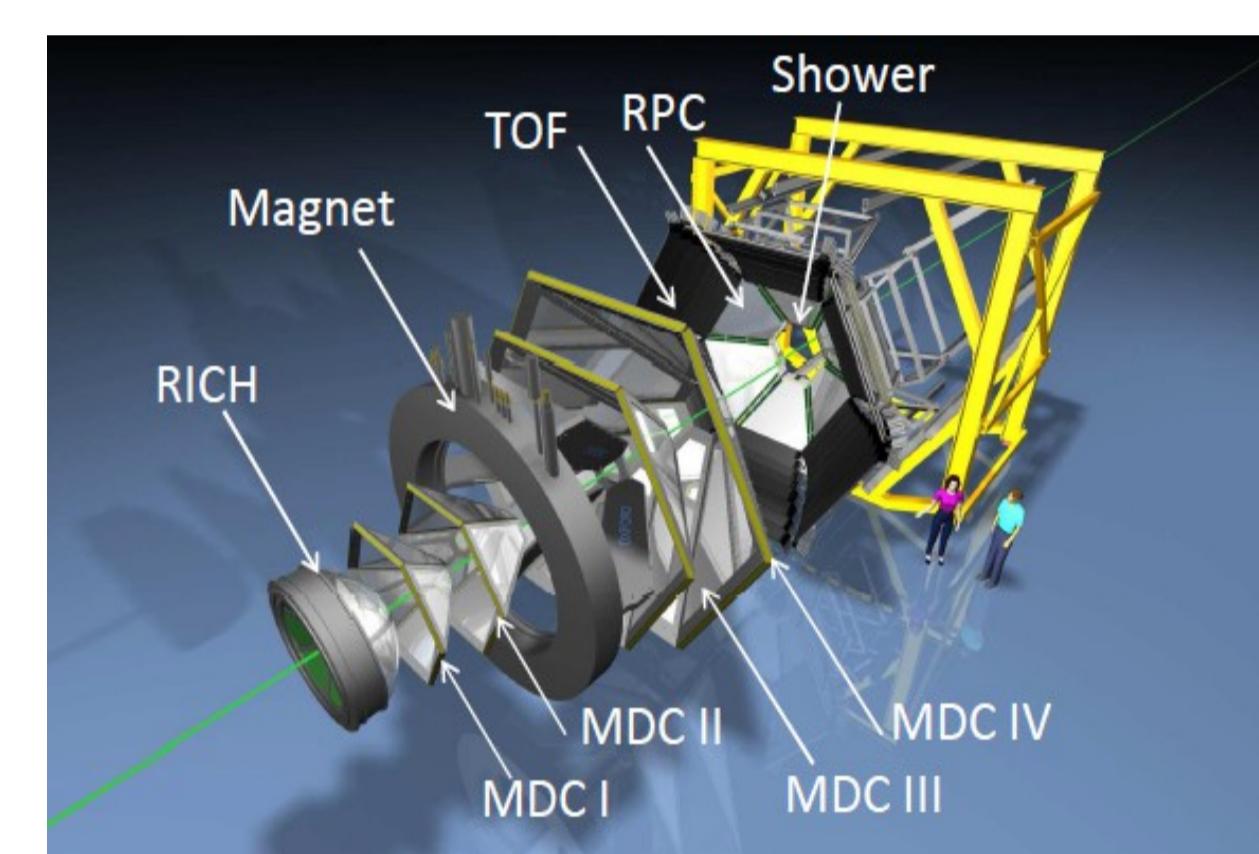

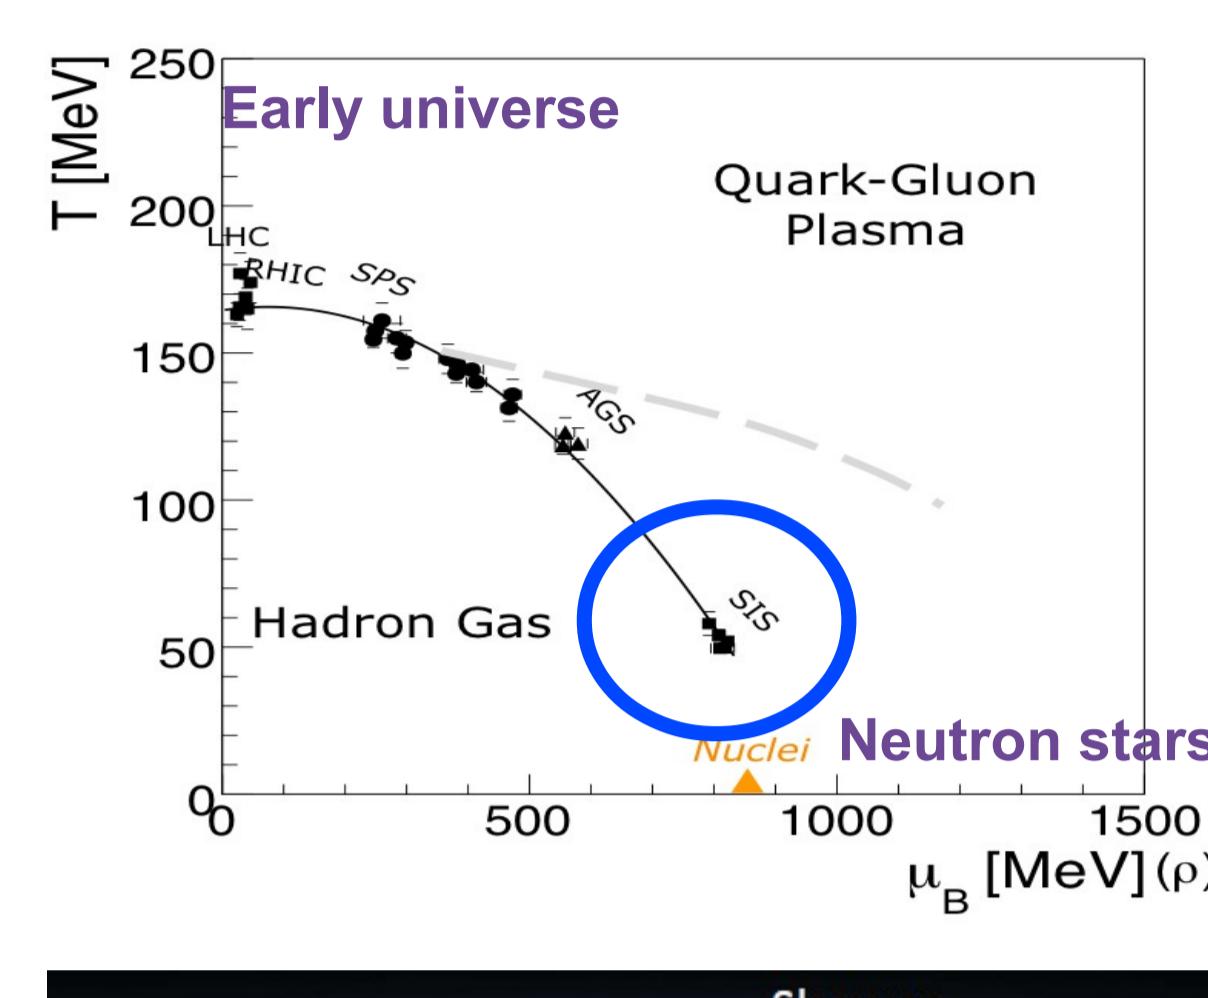

- Heavy-ion collisions
- Elementary reactions ($p+p$, $d+p$, $\pi+p$, $\pi+A$, $p+A$)

Acceptance:

- Full azimuthal angle
- Polar angle $18^\circ - 85^\circ$

Detector components:

- RICH and SHOWER detector for lepton identification
- Multi-wire drift chambers (MDC) combined with a magnetic field for momentum measurement and tracking information. In addition energy loss information
- Time of flight detectors (TOF, RPC) for timing and energy loss information

Motivation

Access to EOS (E) and E_{sym} with Heavy-Ion Collisions (HIC) at SIS18 energies:

$E(\rho, \alpha) = E(\rho, \alpha = 0) + E_{\text{sym}}(\rho)\alpha^2 + \mathcal{O}(\alpha^4)$
with baryon density ρ , isospin asymmetry parameter α and

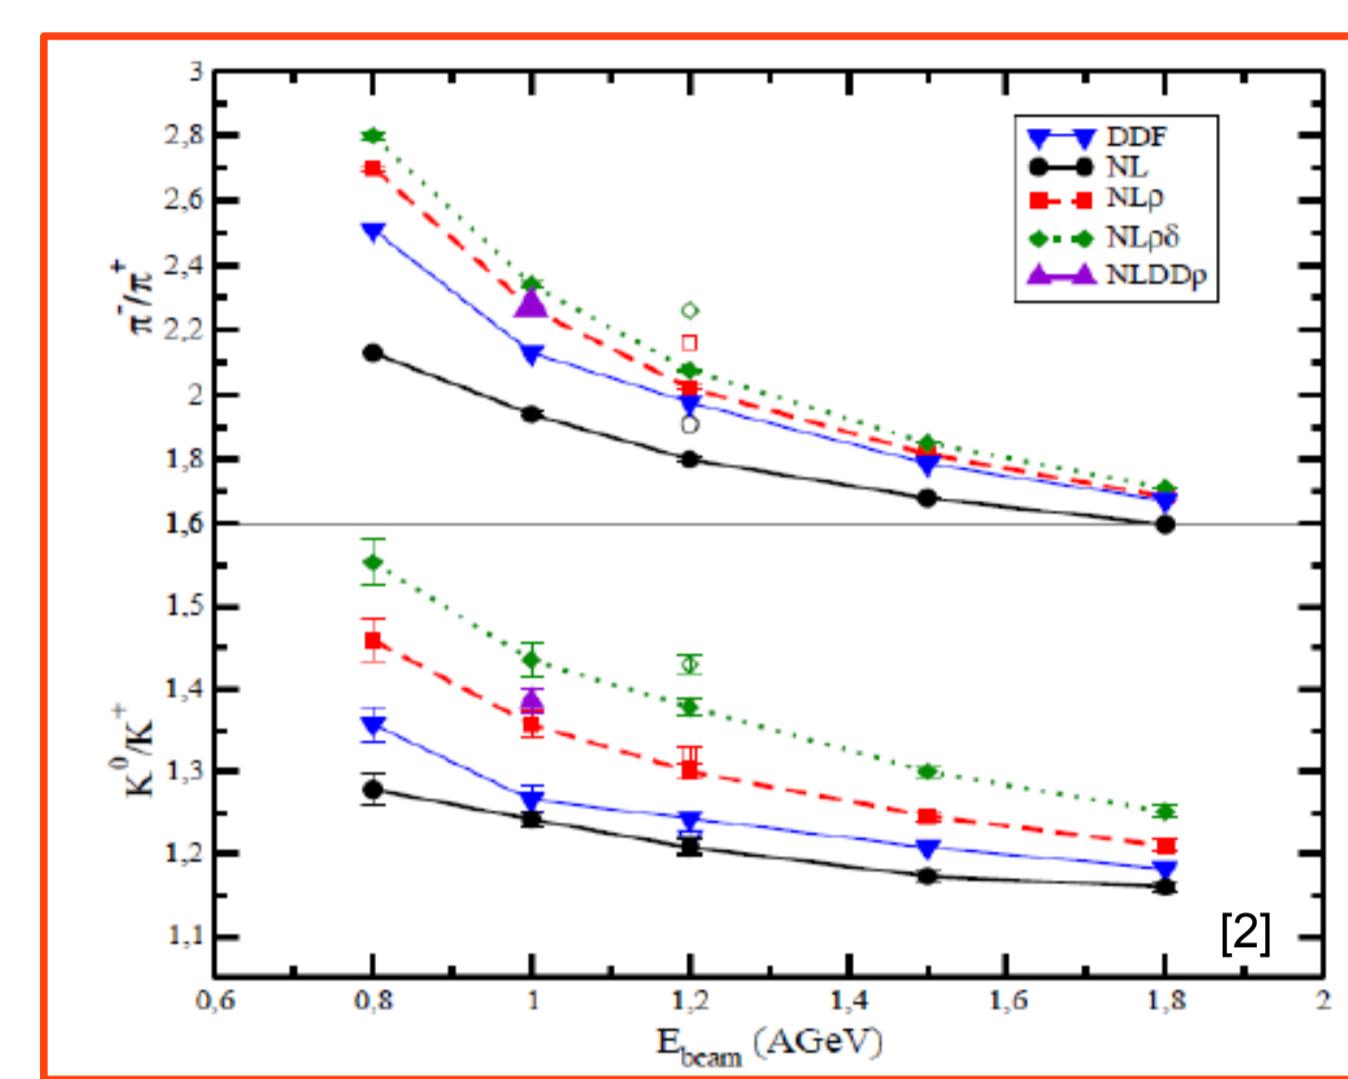

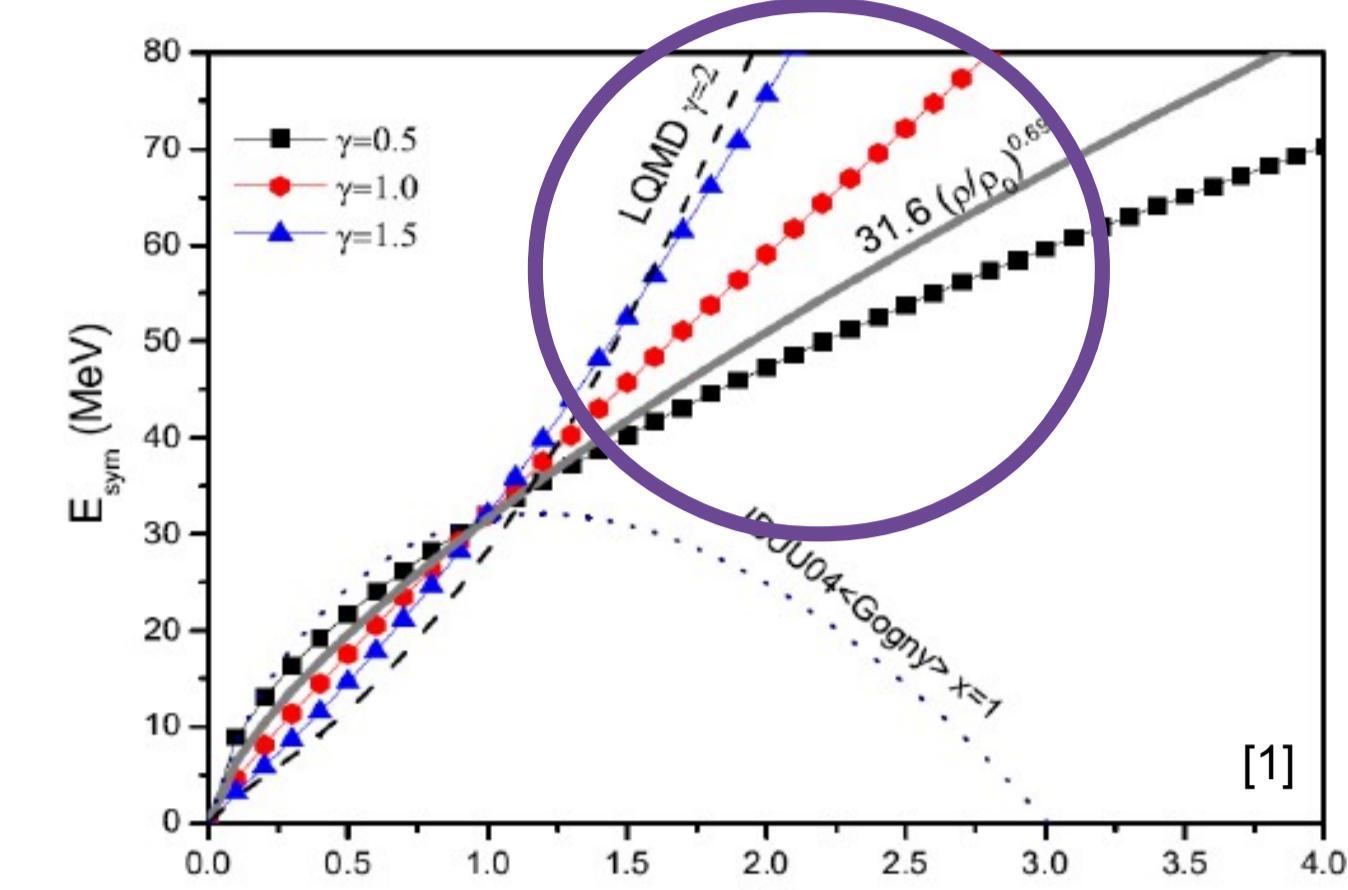

$$E_{\text{sym}} = 22 \text{ MeV} \cdot (\rho/\rho_0)^\gamma + 12 \text{ MeV} \cdot (\rho/\rho_0)^{2/3}$$

- Densities: $\rho_{\max}/\rho_0 \approx 2-3 \Rightarrow$ Sensitive to EOS stiffness γ [1].

- Proposed experimental observable:
Measurement of ratio π^+/π^- & K^+/\bar{K}^0 in isospin asymmetric systems (Au+Au) [2].

⇒ Difference in production rate dependent on asymmetry parameter α .

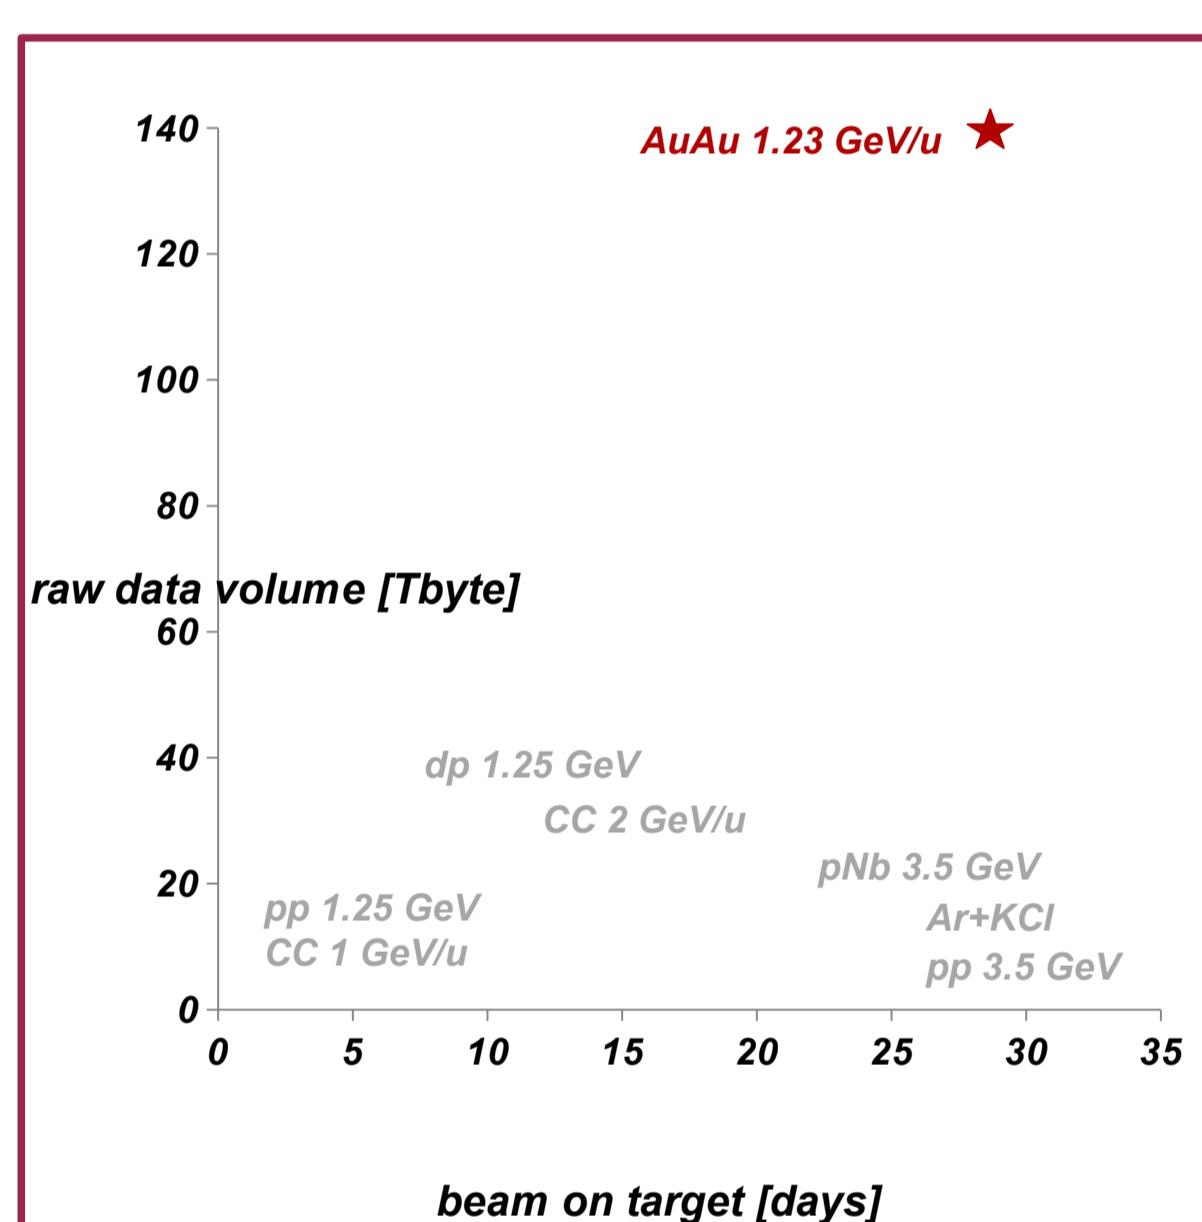

- Subthreshold production of kaons
- Larger sensitivity in K^+/\bar{K}^0 ratio

Au+Au at 1.23 AGeV Beam Time Performance

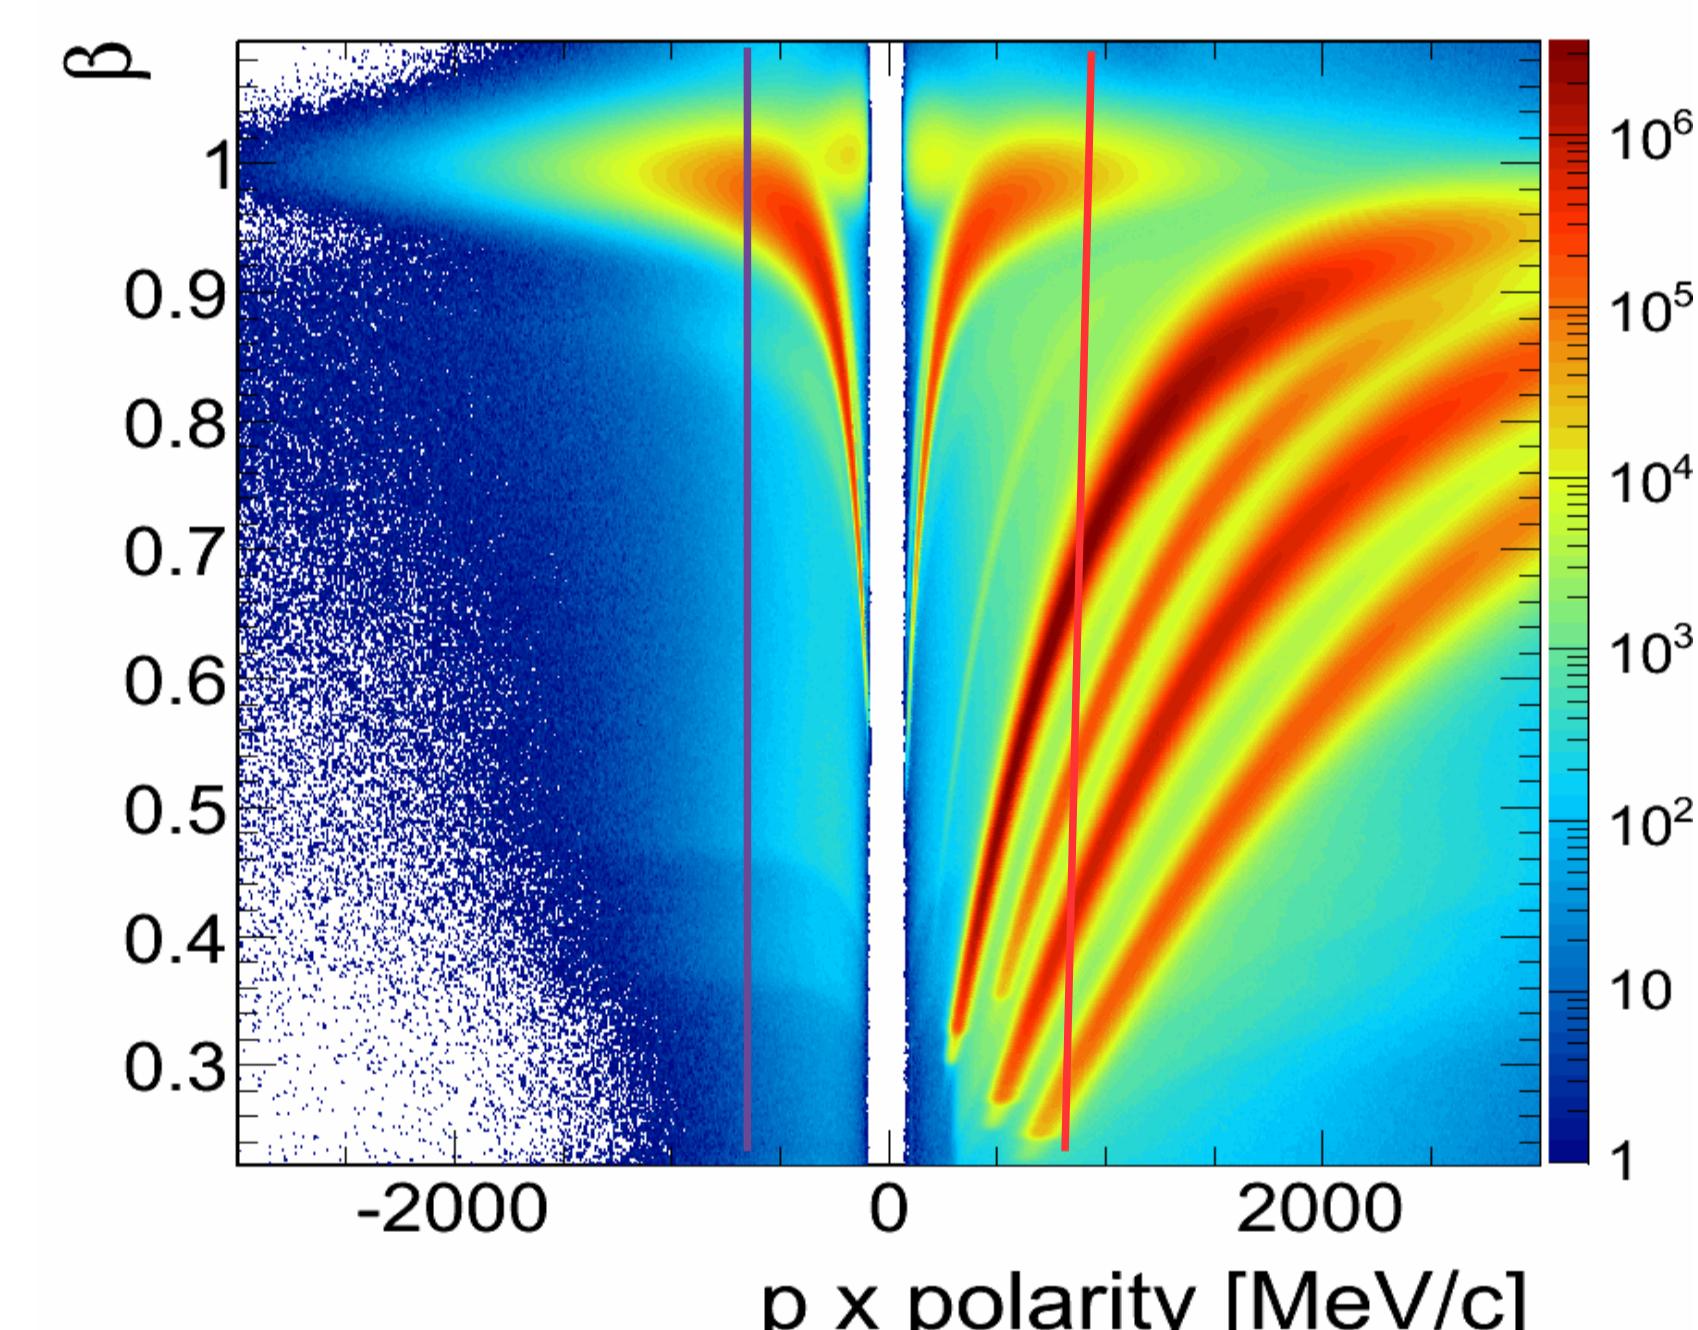

HADES DAQ Performance:

- 557 hours Au beam on Au target
- $(1.2 - 1.5) \times 10^6$ ions per second
- 8 kHz trigger rate
- 200 MByte/s data rate
- 7.3×10^9 events ⇒ 140 TByte of data
- Beam energy 1.23 AGeV
- Segmented Au target
- Trigger on multiplicity in TOF ≥ 20 (PT3)
⇒ $b_{\max} \approx 9$ fm

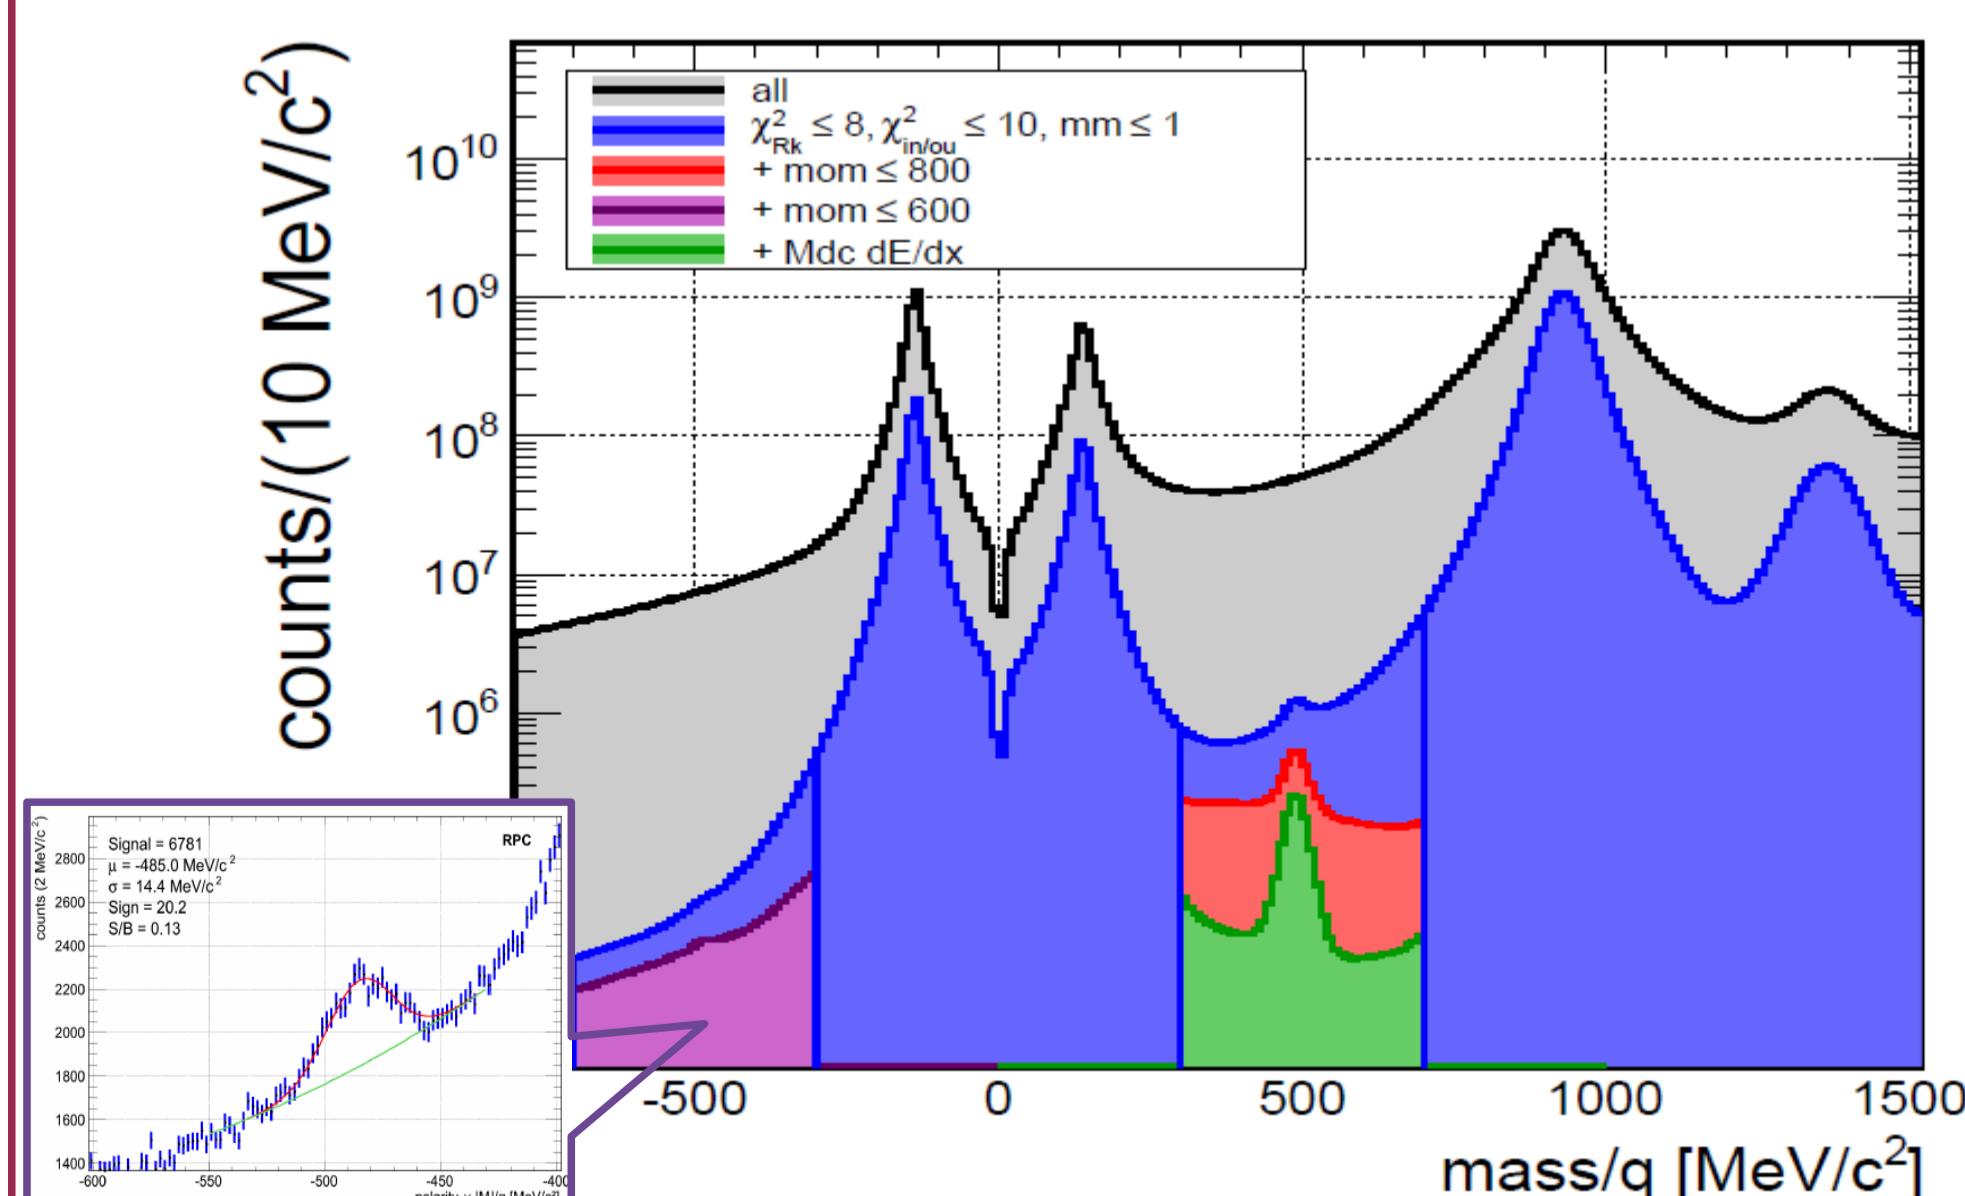

Particle Identification via β vs. momentum:

Kaon Analysis

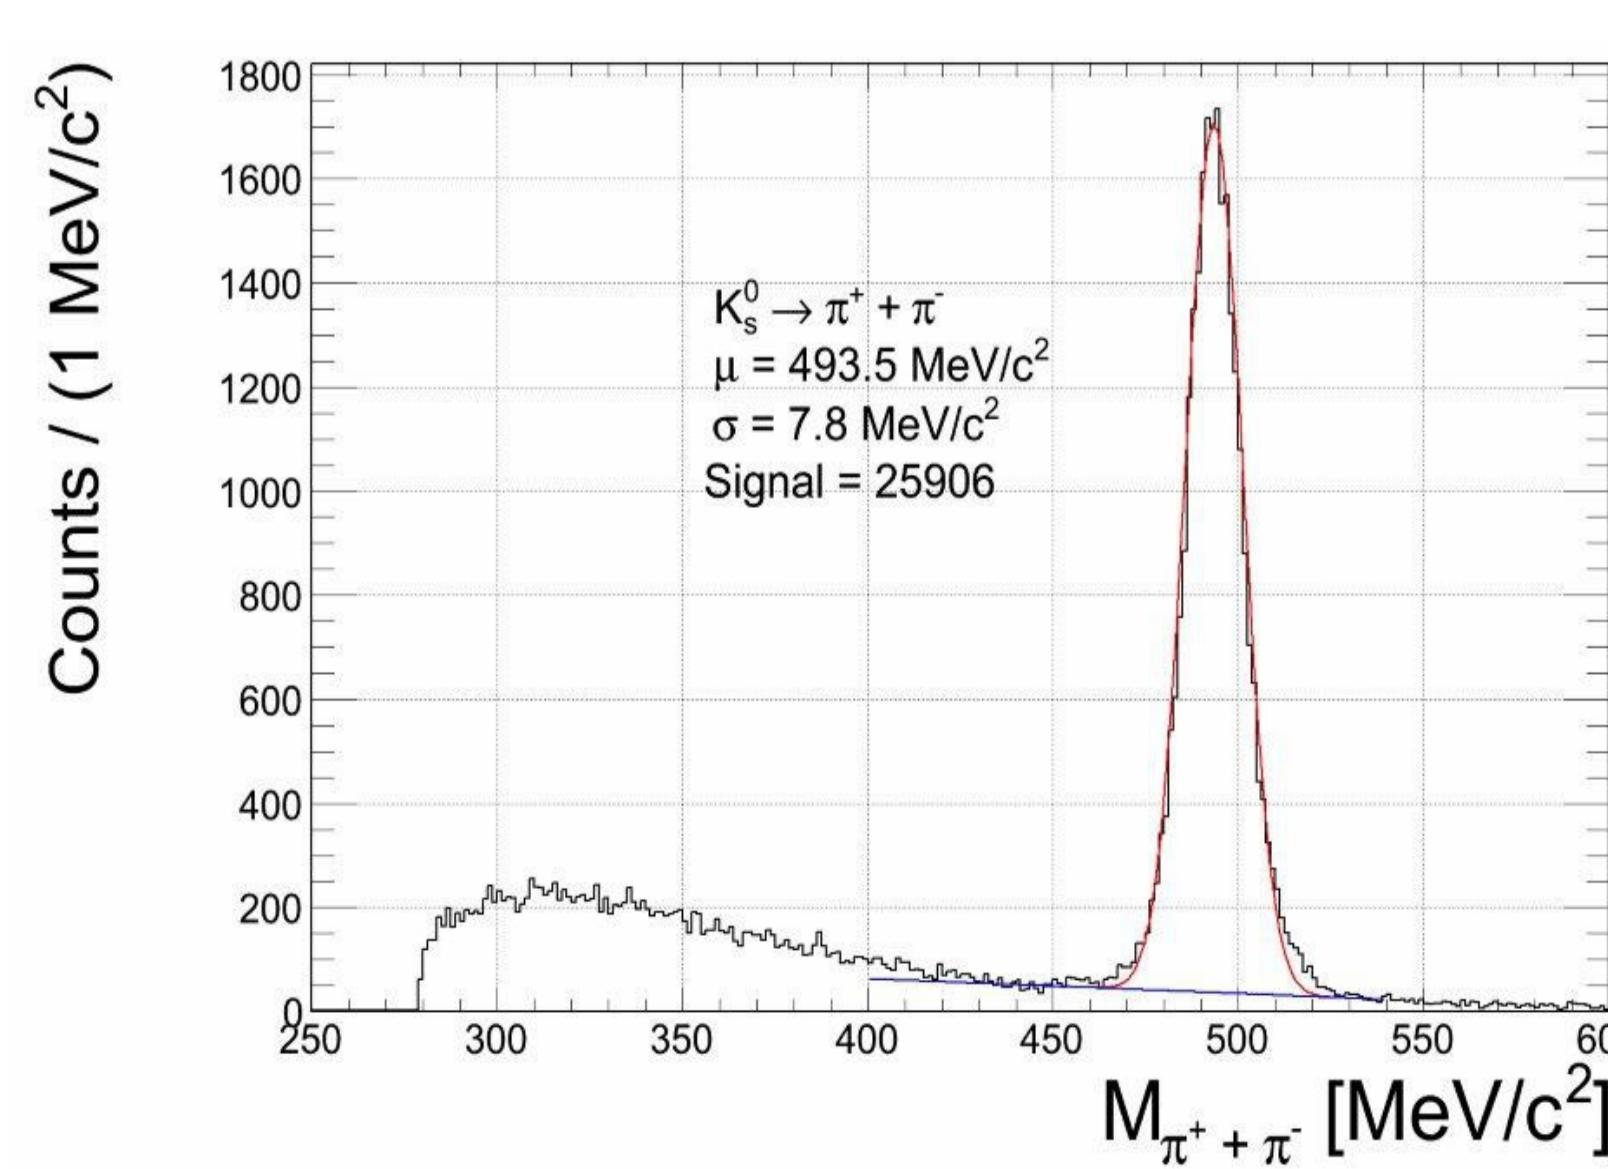

Charged Kaon Identification:

- Combining momentum and time of flight measurements
⇒ Mass spectrum
- Cutting on track quality variables
⇒ K^+ signal visible
- Upper limit for particle momentum and cuts on the energy loss (in MDC) of the particle (only K^+)
⇒ Clear K^+ and K^- signal

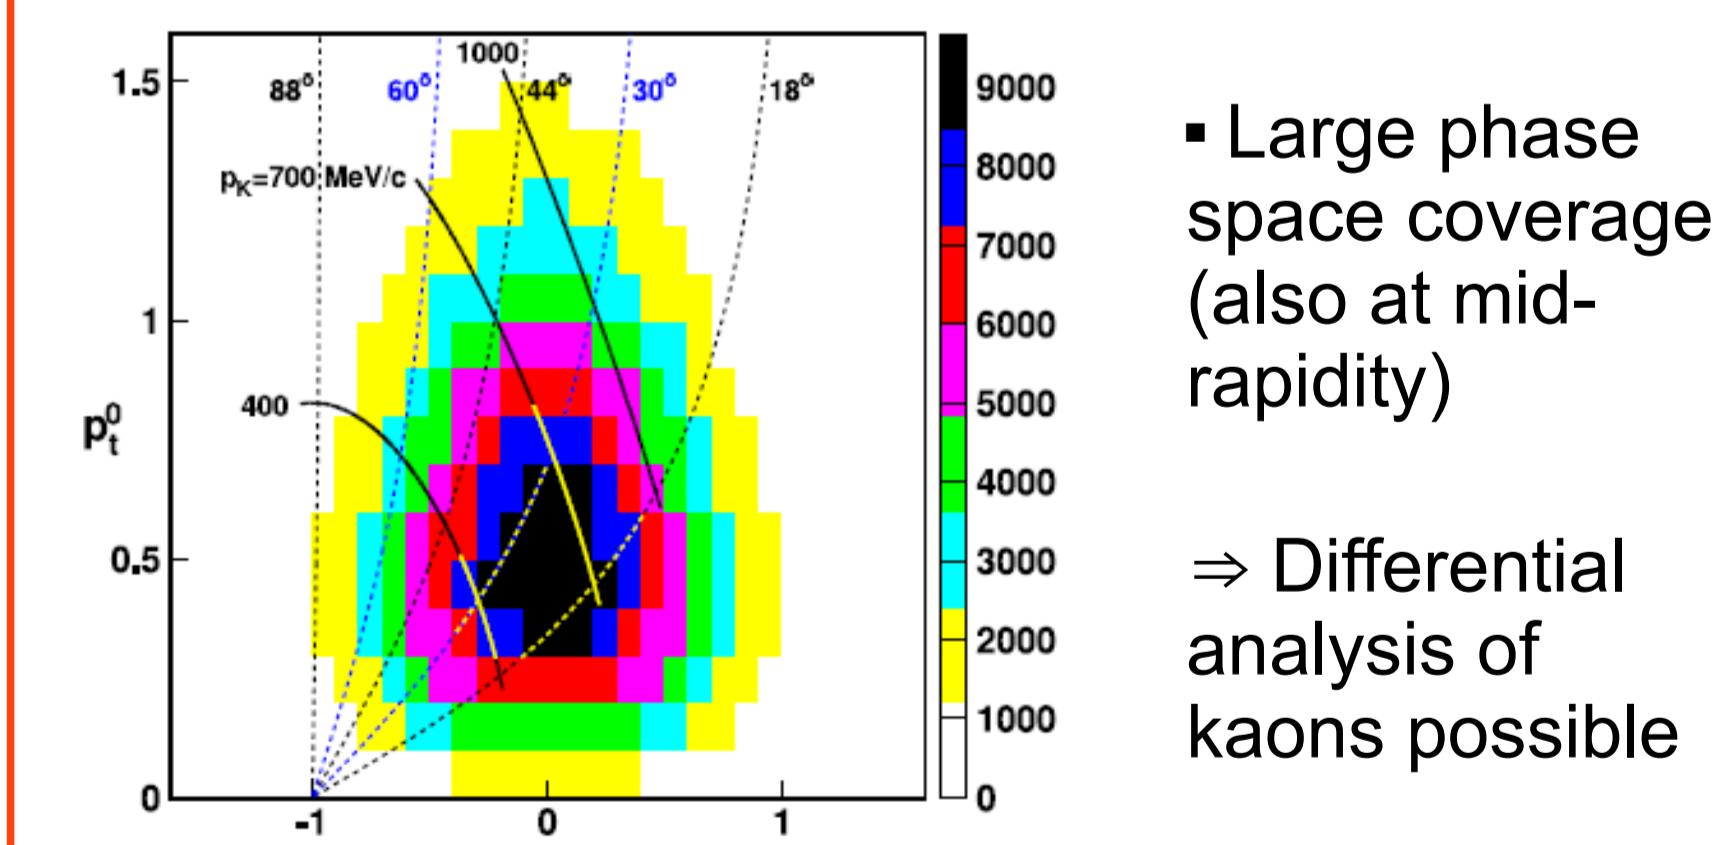

Neutral Kaon Reconstruction:

- Calculate invariant mass M of decay products $\pi^+ \pi^-$
- Cuts on decay topology
- ⇒ Almost background free K_s^0 -signal

HADES Acceptance for Kaons:

Summary

- The K^+/\bar{K}^0 ratio is a promising observable to investigate the EOS symmetry term
- HADES has excellent capabilities to identify charged and neutral kaons in isospin asymmetric Au+Au collisions at 1.23 AGeV, where matter is assumed to be compressed up to $\rho_{\max}/\rho_0 \approx 2-3$.
